

Electromagnetics (I) Final Examination

June 20, 2014

1. In Fig. 1, media 1 and 3 extend to infinity, and medium 2 is a dielectric slab with finite width l . For a uniform plane wave having the electric field

$$\vec{E}_i = E_0 \cos(3 \times 10^8 \pi t - \pi z) \hat{a}_x \text{ V/m,}$$

incident from medium 1 onto the interface $z=0$.

- (1) Please write down the phasor form electric- and magnetic-fields in all three media. (15%)
- (2) Please write down the boundary conditions at $z=0$ and $z=l$. (5%)
- (3) To reduce the reflection (-) wave in medium 1 to zero, please find the suitable ϵ_r and l for medium 2. (10%)
- (4) Please find the time-average Poynting vectors in all the three media and explain the physical meaning of the results briefly. (10%)
- (5) Please calculate the wavelengths in media 1 and 2 and compare them with l obtained in (2). Please briefly explain the physical reason of antireflection (i.e. reflection=0) at the boundary based on the interference of waves and the power density flow. (10%)

Medium 1

(μ_0, ϵ_0)

\vec{E}_i

(+) \rightarrow

(-) \leftarrow

Medium 2

$(\mu_0, \epsilon_r \epsilon_0)$

(+) \rightarrow

(-) \leftarrow

Medium 3

$(\mu_0, 4\epsilon_0)$

(+) \rightarrow

$E_1 = E_2$

$H_1 - H_2 = \rho_0$

$B_1 - B_2 = 0$

$B_1 - B_2 = J_s$

$F = TV$

$$\tau = \frac{2}{1 + \sqrt{\epsilon_r}}$$

Fig. 1 for Problem 1

2. The space between two parallel square conducting plates each having an area S is filled with two different lossy dielectrics as shown in Fig. 2, where the thicknesses $d_1, d_2 \ll S^{1/2} = l$ (the length) so that the fringe effect can be neglected. A battery of dc voltage V is applied across the plates. Please determine

- (1) The steady current densities in both dielectrics (5%) $J = \sigma E$
- (2) The surface charge densities on the interfaces. Please explain briefly their origin. (5%) $\rho_0 \approx \epsilon_0 E$
- (3) If $\sigma_1=0$, please find the potential on the interface $x=d_2$. (8%)
- (4) If $\sigma_1=0$, please find the electric force F_e for the (ϵ_1, μ_1) dielectric in the situation shown as the dashed square in Fig. 2. (8%)
- (5) If $\sigma_1=\sigma_2=0$, please find the capacitance of the system. (8%) $Q = CV$ $C = \frac{Q}{V}$
- (6) If $\sigma_1=\sigma_2=0$ and the voltage source V is changed to a current source I and short-circuited at the other end, please find the external inductance L_e of the system. (8%)
- (7) Continued from (6), if both conductor plates are of finite (ϵ, σ, μ) and thickness d ($d \ll S^{1/2} = l$), please find the internal inductance L_i of the system. (8%)

Fig. 2 for Problem 2

$$V = Adz$$

$$\epsilon_1 \nabla^2 V + \nabla \epsilon \nabla V = 0$$

$$\epsilon_2 \nabla^2 V + \nabla \epsilon \nabla V = 0$$

$$\nabla^2 V = 0$$

$$V = Ax + B$$

$$B = 0$$

$$\nabla^2 V = -\frac{\rho}{\epsilon}$$

とても悲しい。

私は、ずっと一生懸命勉強したのに、何でこのテストは全然できなかった。
