Department of Electrical Engineering

National Taiwan University

Probability and Statistics, Spring 2012

Final Examination

15:30-18:30, Thursday, June 21, 2012

1. (Recitation, 7%) Consider two random variables X and Y. Prove that $E^2[XY] \leq E[X^2]E[Y^2]$.

2. (Recitation, 13%) Ting breaks a unit-length stick at a point randomly chosen in $[0, 1]$. For the piece of length Y that contains the left end of the stick, Ting breaks it again at a random point. Let X be the length of the resulting piece that contains the left end after the second breaking.

   (a) Find the joint probability density function of X and Y. (5%)

   (b) Let Z be the length of the piece with the longest length among the three pieces. Find E[Z]. (8%)

3. (Recitation, 10%) Assume that bus arrivals follow a Poisson process with a mean arrival rate of α per unit time. Let X, Y, and Z be the arrival times of the first, second and the third bus after $t = 0$, respectively.

   (a) Find $f_{X,Y}(x, y)$. (7%)

   (b) Find $f_{Y,Z|X}(y, z|x)$. (3%)

4. (8%) Consider N continuous random variables $X_1, X_2, ..., X_N$ which have cumulative distribution functions $F_{X_1}(x), F_{X_2}(x), ..., F_{X_N}(x)$ with $N \geq 2$. Assume further that these random variables are related by $X_{n+1} = F_{X_n}(X_n)$ for $n \in \{1, 2, ..., N-1\}$. Suppose that the continuous distribution $F_{X_1}(x)$ is known but arbitrary. Derive $F_{X_2}(x), ..., F_{X_N}(x)$.

5. (8%) Consider independent and identically distributed Gaussian random variables X and Y with zero mean, i.e., $E[X] = E[Y] = 0$, and unit variance, i.e., $Var[X] = Var[Y] = 1$. Find the probability density function of $Z = \min(X+Y, X-Y)$ where $\min(u, v)$ denotes the smaller value between u and v.

6. (12%) Let X be a continuous random variable with the probability density function $f_X(x)$ which is an even function, i.e., $f_X(x) = f_X(-x)$. Also, define a new random variable $Y = |X|$. Determine whether each of the following statements is true or false. Prove it if the statement is true. Explain it if the statement is false.

   (a) X has zero mean, i.e., $E[X] = 0$. (3%)

   (b) X and Y are orthogonal, i.e., $E[XY] = 0$ (3%)

(c) X and Y are uncorrelated, i.e., $E[XY] = E[X]E[Y]$. (3%)

(d) If $f_X(x) = \frac{1}{\sqrt{2\pi}} \exp[-x^2/2]$, then X and Y are independent. (3%)

7. (16%) Let the number of jobs, N, submitted to a computer in an hour follow the following distribution: $P(N = n) = p*(1-p)^n$, $n = 0, 1, 2, \cdots$. Let the job execution times T_i's be independent exponentially distributed random variables with a mean of $\frac{1}{\alpha}$ hours.

   (a) Find the moment generating functions of N and T_i. (6%)

   (b) Find α as a function of p so that the computer is not overly loaded. That is, the expected value of the total execution time of the jobs submitted to the computer in an hour is less than 1 hour. (4%)

   (c) Find the pdf for the total execution time of the jobs submitted in an hour. (6%)

8. (16%) Let $X_1, X_2, \cdots, X_n$ be a random sample of a random variable that is uniformly distributed in the interval $[0, \theta]$. Consider the following estimator for θ:

$$\hat{\theta} = \max\{X_1, X_2, \cdots, X_n\}. \tag{1}$$

   (a) Find the pdf of $\hat{\theta}$. (4%)

   (b) Determine whether $\hat{\theta}$ is a unbiased, consistent estimator of θ. (8%)

   (c) Based on your answers in (a) and (b), find an unbiased estimator of θ. (4%)

9. (10%) Let X_i be iid discrete random variables, and $P(X_i = 0) = P(X_i = 2) = \frac{1}{2}$. Let $Y_{100} = \sum_{i=1}^{100} X_i$.

   (a) Estimate $P[10 \leq Y_{100} \leq 12]$ using the central limit theorem. (5%)

   (b) Calculate the exact value of $P[10 \leq Y_{100} \leq 12]$. What is the estimation error (percentage) when using the central limit theorem? (5%)
